

## **CAPITAL-MOHAWK PRISM ~ Regional Invasive Species Ranking (*as of October 2018*)**

### **Tier 1 – Early Detection / Prevention**

*Not in yet PRISM, with anticipated high or very high impacts.* Highest level of survey efforts. Should conduct delineation surveys and assign to appropriate Tier if detected.

Tier 1a: Species not in the PRISM, but in the buffer (surrounding PRISM)

Tier 1b: Species not in PRISM or the buffer, but in Eastern North America (with potential for establishment) Tier 1c: Species far outside PRISM and buffer (not in east NA), but introduction pathway exists

### **Tier 2 - Eradication**

High and very high impact species with low enough abundance to make eradication feasible within the PRISM. Highest level of response efforts. Need delineation surveys to determine full extent. (at the low end of invasion curve)

### **Tier 3 – Containment**

High and very high impact species that are likely too widespread for eradication, but low enough abundance to think about regional containment. Target strategic management to slow the spread since many surrounding regions could be at risk if left unattended.

### **Tier 4 – Local Control**

Well-established species with high and very high impacts. Eradication efforts not feasible; only localized management over time to contain, exclude, or suppress, if justified to meet local management goals. (Suppression efforts)

\*Subcategory: Not established outside of PRISM, manage to contain within PRISM.

### **Tier 5 - Research:**

Species in or surrounding PRISM that need more research, mapping, and monitoring to understand invasiveness and impacts.
